

JavaScript

Scope

```
var x = 10;  
function y() {  
    var x;  
    x = 20;  
}  
y();  
console.log(x);
```

“this”

```
function bowBow() {  
    console.log(this);  
};  
var Balla = {};  
Balla.bowBow = function() {  
    console.log(this);  
}
```

```
//execute  
bowBow();  
Balla.bowBow();  
Balla.bowBow.call({});
```

Hoisting

```
sayHello();  
sayWorld();
```

```
function sayHello() {  
    console.log("Hi!");  
}
```

```
var sayWorld = function() {  
    console.log("World");  
};
```

Closures

```
function makeArmy() {  
    var shooters = [];  
    for(var i=0; i<10; i++) {  
        var shooter = function() {  
            console.log(i);  
        }  
        shooters.push(shooter);  
    }  
    return shooters;  
}
```

```
var army = makeArmy();  
army[0]();  
army[1]();
```

Inheritance

```
function Mother(){}  
Mother.prototype.say = "Hey! I'm the Mother.";   
Mother.prototype.talk = function(){  
    return this.say;  
};
```

```
function Son(){}  
Son.prototype = Mother.prototype;
```

```
var siripala = new Son();  
siripala.say = "I'm Siripala";  
console.log(siripala.talk());  
delete siripala.say;  
console.log(siripala.talk());
```

Strict Mode

```
function foo() {  
    "use strict"  
    x = 3;  
}  
foo();  
console.log(x);
```

Rules of Strict Mode

- Syntax Errors throw exceptions
- value of this will not be auto-coerced to an object
- No Implicit globals
- arguments.caller and arguments.callee banned

The Good parts

- Learn properly
- Variable Scope
- Closures
- Event driven
- Ajax
- Universal - it's everywhere
- JSON

Node.js

“Node.js is a platform built on Chrome's JavaScript runtime for easily building fast, scalable network applications.

Node.js uses an event-driven, non-blocking I/O model that makes it lightweight and efficient, perfect for data-intensive real-time applications that run across distributed devices.”

WEB BROWSER / MOBILE APP

WEB SOCKETS, HTTP + JSON

SERVER
FILESYSTEM

NODE

AMAZON S3

APPLE PUSH
NOTIFICATIONS

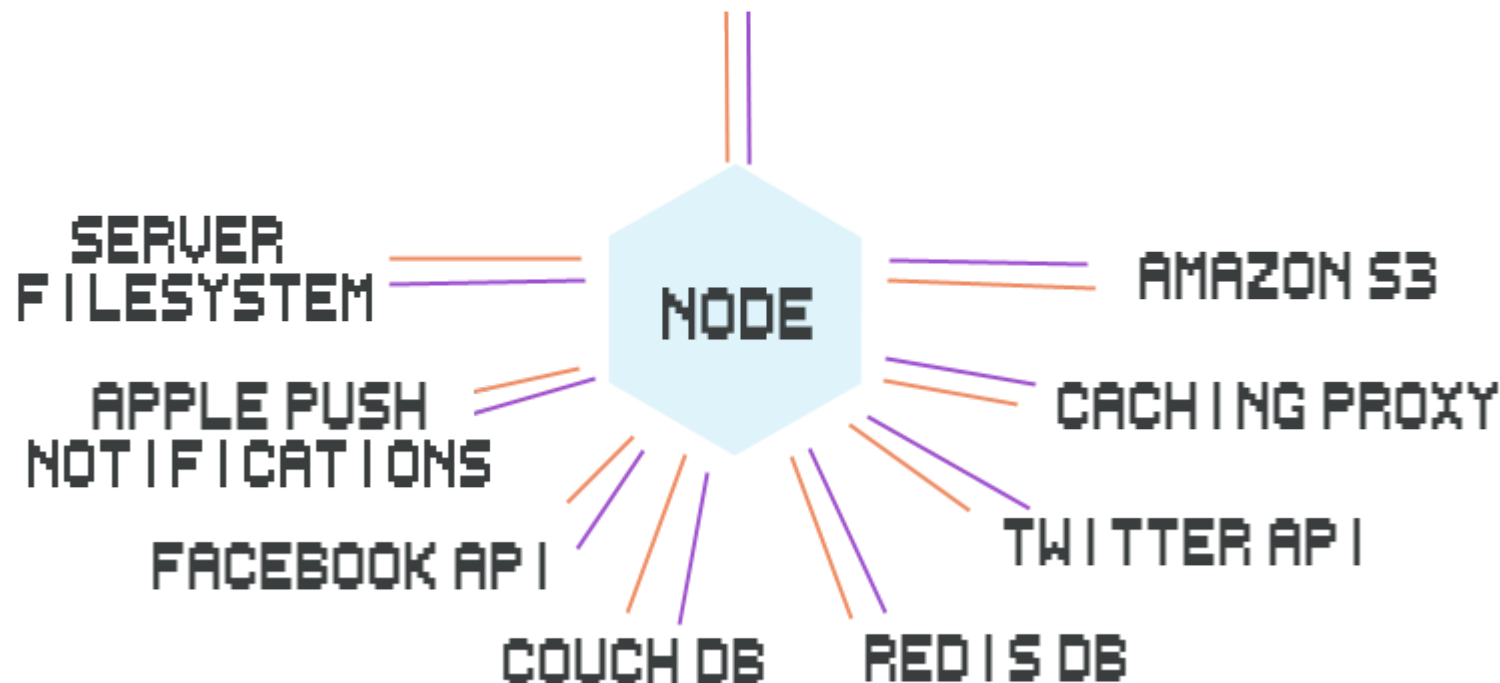

CACHING PROXY

FACEBOOK API

TWITTER API

COUCH DB

REDIS DB

- I/O Based

- Databases (e.g. MySQL, PostgreSQL, MongoDB, Redis, CouchDB)

- APIs (e.g. Twitter, Facebook, Apple Push Notifications)

- HTTP/WebSocket connections (from users of a web app)

- Files (image resizer, video editor, internet radio)

- Node is asynchronous (non blocking)

Example 1

Callbacks

Example 2

NPM

Node Packaged Modules

- Search - *npm search modulename*
- Install - *npm install --save modulename*
- Installs node modules to local folder

require(“modulename”)

1. if a file called modulename.js exists in the current folder node will load that, otherwise:
2. node looks in the current folder for a node_modules folder with a “modulename” folder in it
3. if it doesn't find it, it will go up one folder and repeat step 2

Node

the next step

MEAN

express

MongoDB is the leading NoSQL database, empowering businesses to be more agile and scalable.

Express is a minimal and flexible node.js web application framework, providing a robust set of features for building single and multi-page, and hybrid web applications.

AngularJS lets you extend HTML vocabulary for your application. The resulting environment is extraordinarily expressive, readable, and quick to develop.

Node.js is a platform built on Chrome's JavaScript runtime for easily building fast, scalable network applications.

<http://www.mean.io/>

Install - Example 3

1. *sudo npm install -g meanio*
2. *mean init sampleCMS*
3. *npm install*
4. *grunt*

The background is a black rectangle filled with white, hand-drawn doodles of various celestial and space-related objects. These include stars of different shapes and sizes, planets with rings, a rocket ship, a satellite, a comet, a spiral galaxy, a crescent moon, and various smaller celestial bodies. The doodles are scattered across the entire background, creating a dense, playful pattern.

Meteor JS

Meteor

Meteor is a JavaScript framework, built around many small packages

1. Meteor is "Realtime by Design"
2. "Database Access" from the Client
3. "Latency Compensation"

Meteor : deploy

- *meteor deploy cmstodo.meteor.com*

Or

- *meteor bundle cmstodo.tar.gz*

Tools

Yeoman - *scaffolds out a new application*

Yeoman is used to scaffolding workflows for creating modern webapps, while at the same time mixing in many of the best practices that have evolved within the industry.

Grunt - *The JavaScript Task Runner*

Grunt manages repetitive tasks like minification, compilation, unit testing, linting, etc

Bower - *A package manager for the web*

Bower is used for front-end dependency management, so that you no longer have to manually download and manage your scripts.
